

Breaking-through stagnant medicine concerning intractable immune diseases

K. Nishihara DMSC DMD

The Nishihara Institute

HARA Bldg. 3F, 6-2-5 Roppongi, Minato-ku, Tokyo JAPAN

In conventional medicine and life science the most important concept for life of not only energy metabolism of mitochondria, but also the environmental energy system and the biomechanical energy system of animals themselves have been completely over-looked. Introducing energy metabolism of mitochondria and environmental energy as well as the animals own biomechanical energy of behavior into life science and medicine the author has established Stomato-facial and Neuro-cranial medicine. Today, the most urgent issue in medicine is to rectify the confusion surrounding immunology. For this purpose, we first have to know the entity of the intractable immune disease; then we have to disclose the causes. From these we are able to cure the disease. The author disclosed that intractable immune diseases are not auto-immune diseases but opportunistic infections or autotoxic diseases which are caused by their own non-pathogenic common enteromicrobes. The concept of “auto immunity” and “rebellion of leukocytes” as well as “self- not-self immunology” is a misunderstanding of science. Leukocytes never rebel but are contaminated by enteromicrobes. The author has also disclosed by long-term clinical research that intractable immune diseases, including psychiatry and carcinoma, are severe cases of maladies which have been known ca 50 years ago as opportunistic infections or autotoxic diseases, histiocytosis, granulomatosis, or sarcoidosis, which has been brought about by non-pathogenic common enteromicrobes. These diseases are caused by intracellular infections in various tissues or organs by means of infected granulocytes through Waldeyer’ s lymphadenoid tissue by mouth breathing and through GALT by cooling the gut with cold drinks. Due to intracellular infection, deterioration of mitochondria in infected organ cells occurs. Therefore, at the cellular level, immune diseases take place due to the deterioration of mitochondria by various causes. About 40 years ago, synthetic steroid hormones have been recognized to get immediate improvement against immune diseases. The causes of opportunistic infection have been changed from infection by non pathogenic microbes to allergy by stress of unknown origins. This is a conspiracy because steroid hormones were a contra-indication to be used for infectious diseases. Confusion and disordered immunology, i.e., self-not self immunology, namely not to cure maladies; have started from the concept of immune tolerance of Medawar and Le Douarin’ s experiments. This is the issue of organ transplantation in animals and not the issue of immunity to maladies. Therefore, this is tissue immunity, i.e., animal leukocytes against transplanted organ cells, not immunity to disease against bacteria or viruses. Once the mistaken concept of immunology has been completed, this new pseudo-science will exert a strong influence upon the treatment of immune diseases with mistaken therapeutic concepts. Therefore, this immunology has to be completely destroyed to return therapeutic medicine to its proper place for the treatment of intractable immune diseases. The most effective method to destroy self-not self immunology is to disclose the special function of the thymus, namely characteristic hemopoietic organs of lymphocytes derived from branchial glands as well as the entity of immune tolerance, i.e., the gene expression of MHC. The author disclosed that Chondrichthyes (shark), i.e., archetype vertebrates are all in immune tolerance just like mammalian embryos, even they all have been verified MHC. Then, what is immune tolerance in embryos and archetype vertebrates? Their MHC is dormant and the genes of MHC of embryos and sharks are triggered by a six-fold increase of gravity action after birth as well as landing, which is converted by a six-fold increase in blood pressure in animals. Specialists of self-not self immunology insist that in all animals with MHC skin-grafting cannot be carried out because of MHC. However, the author tried skin grafting between Triakis and Heterodontus, and between Triakis and Xenopus and all succeeded completely. Consequently, the author tried xenogeneic transplantation of the cornea and of a part of the intestine from Triakis to dog, and a part of the brain from shark to rats. By these successful xenogeneic transplantations the author completely over-ruled the concept of self-not self immunology. Intractable diseases are largely categorized into following three: 1) Intractable immune diseases-common immune diseases 2) Mental illness-an intracellular infection in neurons defined in the brain. 3) Carcinoma-a mode-specific immune disease in which intracellular infection of multiple virus and bacterial contamination occurs, resulting in the deterioration of mitochondria by which disorder of the negative feedback regulation system of cell division are brought about. In conclusion, all kinds of intractable immune diseases, including psychiatry and carcinoma, are intracellular infections of respective organ cells by common enteromicrobes, therefore, they can be prevented, treated, and cured by means of energy control as well as adequate treatment with bifidus factor and antibiotics or antiviral agents by a proficient practitioner of stomato-facial and neuro-cranial medicine when the case is not too late.
